**A GUNFIRED
Add-On**

Pendant transmits to in-range repeaters

Repeaters transmit to the receiver

The receiver passes messages to the OnConx
Software on the processor

The processor sends outgoing pager messages to the paging transmitter via OnConx software

The paging transmitter sends messages to pagers based on contacts defined in the OnConx database

Sample pager message:

ALERT: Siting by Joe Smith near 1st floor southeast staircase at 10:35 am.

How it works:
- Pendant descriptions are configurable i.e.
- Pendant 123, Joe Smith, Night Guard 1, etc.
- Repeater locations are configurable, i.e.
- 1st floor southeast staircase, North end of cafeteria, W end of S hall, etc.
- When a pendant is pressed, repeaters within transmission range report it.
- The report with the strongest signal is used in the pager message.

And More:
- Text message notifications
- Email notifications
- Pendant locator
- Custom reporting
- Alert mapping

****

Other OnConx Systems are available
for land mobile radios and GPS tracking devices.
